

WhatsApp chatbot backend simulation using java and spring boot

The Core Problem

“Build a backend system that receives a message and returns an appropriate reply.”

Requirements

system must:

- Accept input (message)
- Understand it (basic logic)
- Decide a reply
- Send response back

So the real challenge is:

Designing a request → processing → response flow

Input → Output Thinking

Input: "Hi"

Output: "Hello"

Input: "Bye"

Output: "Goodbye"

Input: "Something else"

Output: "I don't understand"
